How To Build A Methane Producing Bio-Digester. DIY Biogester. (The Debt Killer Book)

Synopsis

Nature breaks down waste products cleaner then humans could ever dream of. Millions of microscopic critters called Anaerobic & Aerobic bacteria do the job of 10 garbage dumps in a matter of months. Not to mention we save the land fills from taking over the neighborhood. You will learn how to build a Home Bio-Digester system that will convert 99% of your garbage naturally into 100% dark, rich fertilizer, suitable for adding directly onto plants, garden, trees or landscaping & cleaner burning fuel (methane) that can be used for cooking in your stove or back yard barbecue grill, heating, electricity generation or as a gasoline substitute in your vehicle.

A bio-digester is a necessary component to a self-sufficient home. Previously, bio-digesters were too expensive to build for the average home owner, making them a non-viable option when desiring to provide your own energy. How to Build a Methane Producing Bio-Digester, a DIY Bio-digester, is a well-informed manual to building your own energy source. This bio-digester uses common household materials, such as water heaters, to build a renewable energy source to provide enough methane gas to power all the household needs. This book provides very precise instructions with a

step-by-step plan to build and install your bio-digester. The author, an aerospace structural engineer, goes into great detail to demonstrate exactly what supplies are needed and how to procure them at minimal cost. Each stage of the development of your bio-digester is thoroughly explained; there is even a trouble-shooting guide at the end of the book for odd inconveniences. After the bio-digester has been installed, the author provides a list of anaerobic materials to make and maintain your methane gas supply. With your bio-digester you can cook and power all of your household energy needs, eliminate the utility bills, and become truly self-sufficient.

Great combination of scientific understanding behind methane production and self-sustainable solutions, as well as a practical guide to construction utilizing a 55-gallon drum or 40-gallon water heater. Had to deal with some grammatical errors, and for this a 4-star rating.

This book gets well into the practical side of renewable energy, but is does so in a rather narrow way that is focused building a certain kind of model. There is much room left for the theoretical here. The book also suffers from noticeable spelling and formatting mistakes and so stands to improve from editing. None of this, however, takes away from that fact that it is a place to start practically for those who might otherwise be overwhelmed by the task of actually applying knowledge about bio-digesters.

They explain how to make it out of a water heater. Most of the components needed are already on a water heater, so they explain it so that it's simple for you and low budget. All you need to do is get a few more small parts such as valves, gauges, etc. Before I purchased this, most of the previous free stuff that I found online was too complex and required a pit-kind of like 3rd world stuff.

Easy to follow step by step guide. Can't wait to build one. Sounds pretty simple and fool proof and safe.

Good idea, fairly easy to understand, not large enough to run very much.

The instructions here seem easy to follow. This seems to be a low space, easy solution to domestic cooking and Heating fuel. I plan to give the project a try in the spring.

Detailed information on how to build a biogas digester, what to do and what not to do, great

purchase. You will like this book if you want to build an in house biodigester
